Abstract: An online food token management system is a software solution designed to facilitate the ordering and management of food tokens for food services, such as cafeterias, canteens, and halls. This system allows customers to pre-order their meals, pay for them in advance, and . It also enables customers to place orders, pay online, and receive tokens electronically, eliminating the need for physical tokens. which also eliminates the need for cash transactions and saves time for both customers and food outlets. The software also allows administrators to manage menus, track inventory, and generate reports on sales and customer behavior. With the increasing demand for contactless transactions and the need for efficient and transparent management of food services, online food token management systems have become an essential tool for food service providers. This paper explores the features, benefits, and challenges of online food token management systems and their potential impact on the food service industry. The system also provides real-time monitoring of inventory and sales, enabling accurate forecasting of demand and supply. Additionally, it can provide valuable insights into customer behavior and preferences, which can be used to optimize operations and improve profitability. Overall, an online food token management system offers a streamlined and convenient solution for managing food orders and payments in various settings.
